# ENGINEERED SOLUTIONS

## **Bulletin BES 07-21**

**Subject:** Rear brake squeal

**Vehicle Involved:** 2005 2007 Acura RL model

**Condition:** The rear wheel squeals during the first few brake applications in the morning.

**Repair Procedure:** Rear wheel brake noise which occurs during the first few brake applications when the brakes are cold may be caused by improper brake pad material.

Refinish the rear brake rotors surface and install new pads. In areas that use salt on the roads for ice control, the noise may not be avoidable. In those areas follow normal installation and lubrication to minimize the noise.
